EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Stuart Auvinen on January 26, 2006.

The application has been amended as follows:

Claim 11, line 7, the word, "the" before "first resistance" has been changed to --a--.

Claim 13, lines 11-12, the phrase, "or a logical equivalent" has been deleted.

Claim 18, line 14, the word, --the-- has been added before "dynamic termination circuits".

Claim 19, line 8, the word, --the-- has been added before "segments".

Claim 21, line 1-2, the phrase, "further comprising: a" has been deleted and replaced by -- wherein the --. On line 2, the word, "that" between "substrate" and "drives" has been deleted.

Reasons for Allowance

Claims 1-25 are allowable over the prior art of record.

The following is an examiner's statement of reasons for allowance: the best prior art of record, Greeff et al., taken alone or in combination of other references, does not teach or fairly suggest a memory module comprising, among other things, a switch-signal generator, mounted on the substrate, receiving the chip-select signal and the clock signal, the switch-signal generator

generating the switch signal in the active state synchronously to the clock signal when the chip-select signal is activated to select the plurality of memory chips for access by the main board, whereby the low-impedance path terminates the terminated signal line in response to the switch signal (claim 1); switch timing logic, receiving the chip-select signal and the clock signal, for pulsing activate the switch signal when the chip-select signal selects the plurality of synchronous memory chips for access during a portion of a period of the clock signal (claim 23); and switch-signal generator means, mounted on the substrate means, receiving the chip-select signal and the clock signal, the switch-signalizing the switch generator means generating the switch signal in the active state synchronously to the clock signal when the chip-select signal is activated to select the plurality of memory chips for access by the main board, whereby the high-current resistor means terminates the terminated signal line means in response to the switch signal (claim 25), as set forth in the claims.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
